Minecraft 4096x4096 texture pack can be a great way to improve the look of your characters and terrain. This texture pack will give you a true 4K resolution, or 4096 x 4096 pixels, which is more than enough even for 4K displays.

A texture pack will replace all of the textures in Minecraft, but you have to have at least 1.8 GB of free space on your system before you can download this one without being warned about an insufficient amount of memory. The installation instructions are also quite lengthy in order to make sure that the new textures won't impact any old saved games in your Minecraft game folder (the instructions recommend backing up your existing content). Minecraft 4096x4096 texture pack can be beneficial for many reasons, but also for others. First of all there are the gamers that don't have the required space to install a bigger texture pack. Another reason is that most of the textures are in BMP or PNG format which is very easy to convert in certain image editors. For people who are trying to make their own custom maps using Open Source games adding Minecraft 4096x4096 texture pack into your game will give you a complete look, without the need to create new assets. Minecraft's textures were decreased in size from 1.8 to 2, 3 and now a 4 times, so this texture pack is going to be a great way to improve the look of your characters and terrain. This texture pack will give you a true 4K resolution, or 4096 x 4096 pixels, which is more than enough even for 4K displays. For those who have been using 1.8 before I recommend that you re-download all your textures from this site as they have been slightly improved with 1.12 to increase the detail. They have also included some new textures that were only added in later versions of Minecraft; these include new banners, minimaps and border fences. The installation instructions are also quite lengthy in order to make sure that the new textures won't impact any old saved games in your Minecraft game folder (the instructions recommend backing up your existing content). "Minecraft 4096x4096 texture pack can be beneficial for many reasons, but also for others. First of all there are the gamers that don't have the required space to install a bigger texture pack. Another reason is that most of the textures are in BMP or PNG format which is very easy to convert in certain image editors. For people who are trying for example to make their own custom map using Open Source games adding Minecraft 4096x4096 texture pack into your game will give you a complete look, without the need to create new assets. Minecraft's textures were decreased in size from 1.8 to 2, 3 and now a 4 times, so this texture pack is going to be a great way to improve the look of your characters and terrain. This texture pack will give you a true 4K resolution, or 4096 x 4096 pixels, which is more than enough even for 4K displays."
